Object-Oriented Programming concepts

Videogames Technology

Objective

- Understand the meaning of paradigm
- Introduce the main OOP concepts
- Basic Java syntax for classes

Bibliography

1. The JavaTM Tutorials. Oracle. (Link)

Readings

- I. Intro to Object-Oriented Programming for Game Development. (Link)
 - 2. Game Architecture Day 2. (Link)

Table of Contents

- I. Programming paradigms
 - Programming, programming language and paradigm
 - Programming paradigms types
 - Declarative programming
 - Imperative programming
 - Object-Oriented Programming
 - OOP objectives
- 2. Object-Oriented Programming
 - Basic concepts
 - Synthesizing OOP terminology
 - Inheritance
 - Polymorphism
 - Abstraction and encapsulation
- 3. Java OOP concepts
 - Classes in Iava
 - Inheritance in Java
 - Interfaces
 - Packages
 - Javadoc
- 4. Exercises
 - Exercise T: Asteroids
 - Exercise 2: Tetris
 - Exercise 3: Pac-Man

Programming, programming language and paradigm

Programming

Programming paradigms

Set of techniques that allow the development of programs using a programming language

Programming language

Set of rules and instructions based on a familiar syntax and later translated into machine language which allow the elaboration of a program to solve a problem

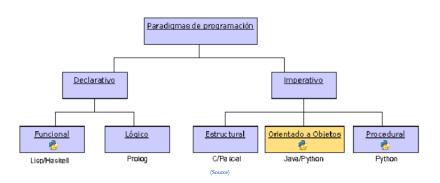

Paradigm

Set of rules, patterns and styles of programming that are used by programming languages

Programming paradigms

Programming paradigms types (I)

Many other paradigms: Event-Driven programming, Concurrent, Reactive, Generic, etc

Declarative programming

Declarative programming

Describe what is used to calculate through conditions, propositions, statements, etc., but does not specify how

- Logic: First order logic in order to formalize facts of the real world (Prolog)
 - Example: Anne's father is Raul, Raul's mother is Agnes. Who is Ana's grandmother
- Functional: Based on the evaluation of functions (like Maths) recursively (Lisp, Haskell, R)
 - Example: The factorial from o and r is r and r is the factorial from r * factorial (r-r). What is the factorial from 3?

Imperative programming

Imperative programming

Describes, by a set of instructions, how the task should be implemented

- **Procedural**: Collections of subroutines related by means of invocations (C, Python)
 - Example: The cooking process consists of 20 lines of code. When it is used, it only calls the function (1 line)
- Structural: Nesting, loops, conditionals and subroutines. GOTO command is forbidden (C, Pascal)
 - Example: Reviewing products of a shopping list and add the item X to the shopping if it is
 available

Object-Oriented Programming

Object-Oriented Programming

Evolves from imperative programming. It is based on objects that allow express the attributes and behavior in a closer way to real life (Java, Python, C++, C#)

- Main characteristics: Abstraction, encapsulation, polymorphism, inheritance, modularity, etc
 - Example: A car has a set of properties (color, fuel type, model) and a functionality (speed up, shift gears, braking)

OOP objectives

OOP tries to provide

- Reusability: Ability of software elements to serve for many applications
- Modularity: Capacity to divide a program
- Extensibility: Ease of adapting software products to specification changes
- Usability: Ease of using the tool

OOP relays on a set of abstract concepts

Basic concepts (I)

Class

Generic entity that groups the properties and functions of an entity

Basic concepts (II)

Atribute

Individual characteristics that determine the qualities of an object

Basic concepts (III)

Method

Function responsible for performing operations

Basic concepts (IV)

Object or instance

Specific representation of a class, namely, a class member with their corresponding attributes

Basic concepts (V)

Constructor

Method called when an object is created. It allows the initialization of attributes

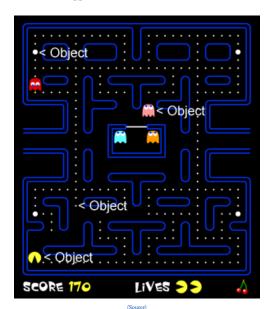

Synthesizing OOP terminology (I)

- Software objects mimics physical objects
 - An object contains attributes and a behaviour
 - Example: A dog has a name (attribute) and may bit (behaviour)
- A class is a set of objects with common characteristics and behaviour
- An object is called an instance of a class
- Members of a class:
 - Properties: Data describing an object
 - Methods: What an object can do

Synthesizing OOP terminology (II)

Synthesizing OOP terminology (III)

+ HandleInput()

Wave
Attributes
+ Difficulty: int

Methods
+ GenerateEnemies()

Enemy
Attributes
+ Position: Vector2
+ Type: int
Methods
+ Move()

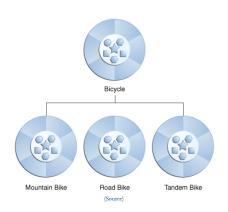

Inheritance (II)

Mechanism of reusing code in OOP. Consists of generating child classes from other existing (super-class) allowing the use and adaptation of the attributes and methods of the parent class to the child class

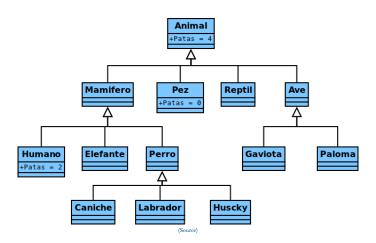

- Superclass: ``Father" of a class
- Subclass: ``Child" of a class
- A subclass inherits all the attributes and methods from its superclass
- Class hierarchy: A set of classes related by inheritance

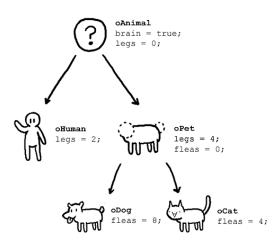

Inheritance (II)

Inheritance (III)

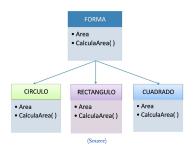

Inheritance (IV)

Polymorphism (I)

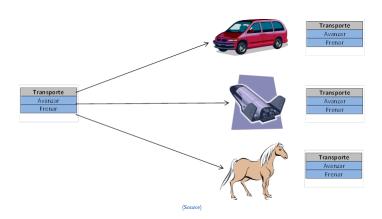

Polymorphism

Invoke a method whose implementation will depend on the object that contains it

Polymorphism (II)

Abstraction

Abstraction

Mechanism that allows the isolation of the not relevant information to a level of knowledge

- A driver does not need to know how the carburator works
- To talk on the phone does not need to know how the voice is transferred
- To use a computer do not need to know the internal composition of their materials

Encapsulation

Encapsulation

Provide an access level to methods and attributes for avoiding unexpected state changes. This mechanism is used to limit the visibility of the attributes and to create methods controlling them (set() y get()).

The most common access levels are:

- public: visible for everyone
- private: visible for the creator class
- protected: visible for the creator class and its descendents

Classes in Java (I)

Bicycle.java public class Bicycle { private int cadence = 0; private int speed = 0; private int gear = 1; public void changeCadence(int newValue) { cadence = newValue: public void changeGear(int newValue) { gear = newValue; public void speedUp(int increment) { speed = speed + increment; public void applyBrakes(int decrement) { speed = speed - decrement;

Classes in Java (II)

```
BicycleDemo.java
class BicycleDemo {
    public static void main(String[] args) {
        Bicycle bike1 = new Bicycle();
        Bicycle bike2 = new Bicycle();
        bike1.changeCadence(50);
        bike1.speedUp(10);
        bike1.changeGear(2);
        bike2.changeCadence(50);
        bike2.speedUp(10);
        bike2.changeGear(2);
        bike2.changeCadence(40);
        bike2.speedUp(10);
        bike2.changeGear(3);
```

OOP concepts

Inheritance in Java (I)

BicycleDemoInheritance.java

Interfaces (I)

Interface: Set of methods without implementation

- Methods related to each other
- Expose a behaviour
- All methods in a interface must be implemented
- Imitates multiple inheritance
- Interfaces can be instanciated

Interfaces (II)

Bicycle.java

```
interface Bicycle {
 // wheel revolutions per minute
 void changeCadence(int newValue);
 void changeGear(int newValue);
 void speedUp(int increment);
  void applyBrakes(int decrement);
```

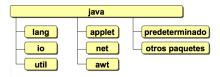

ACMEBicycle.java

```
class ACMEBicycle implements Bicycle {
 // remainder of this class
  // implemented as before
```

Packages (I)

- A typical Java project might content thousands of classes
 - Some kind of classes organization is needed
- Package: A collection of related classes
 - Packages are ``folders" of classes
 - ... there is a direct mapping package-folder, indeed
 - Technically speaking, packages separate namespaces
 - Packages are defined using package in the begining of a class
- Packages must be declared to be used within a class
 - Reserved word import

Packages (II)

bicycles/ACMEBicycle.java

demo/BicycleDemo.java

```
import bicycles.*;
class BicycleDemo {
  public static void main(String[] args) {
    Bicycle bike = new Bicycle();
    bike1.changeCadence(50);
  }
}
```

Packages (III)

Compile with

- javac bicycles/Bicycle
- javac demo/BicycleDemo

Execute with

• java demo.BicycleDemo

Packages imported by default

- Package java.lang
- Same package

Watch out the CLASSPATH!

- CLASSPATH: Environment variable, Java version of PATH
- It stores the packages (and classes) locations

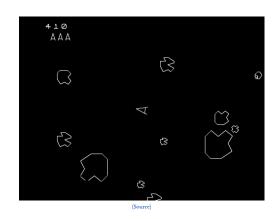

Javadoc

- Javadoc generates documentation from the source code
- Comments begining with /** are Javadoc comments
 - They are included in the Javadoc documentation
- Getting used to handle Javadoc is critical!
 - Reference API documentation in any Java library is in Javadoc format
 - Try to use it in your code

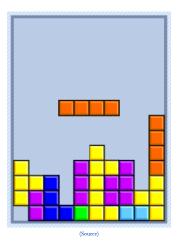

Exercise 1: Asteroids

- Identify the classes in the Asteroids videogame
- 2. Identify attributes contained in the previous classes
- 3. Identify methods contained in the previous classes

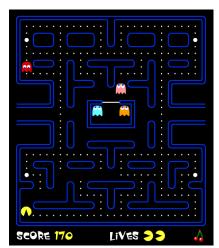

Exercise 2: Tetris

- Identify the classes in the Tetris videogame
- 2. Identify attributes contained in the previous classes
- 3. Identify methods contained in the previous classes

Exercise 3: Pac-Man

- Identify the classes in the Pac-Man videogame
- 2. Identify attributes contained in the previous classes
- 3. Identify methods contained in the previous classes
